FACTSHEET

Standard Fresh Frozen Plasma (FFP)

Information for Healthcare Professionals

The indications for transfusing FFP are limited and specific. Transfusion of plasma-rich components is associated with an increased risk of adverse events compared to red blood cells.

Please transfuse appropriately.

Fresh Frozen Plasma (FFP)

FFP is leucodepleted plasma that has been obtained from whole blood donations or by apheresis from a male donor. Plasma is sourced from male donors to reduce the risk of transfusion-related acute lung injury (TRALI). The plasma has been rapidly frozen to below -25°C, to maintain the integrity of labile coagulation factors, and may be stored for up to 36 months.

Clinical indications for the use of FFP*

- **Major Haemorrhage** – Early infusion of FFP is recommended in a ratio of 1-unit FFP to 1-unit red cells for trauma and at least 1-unit FFP to 2 units of red cells in other major haemorrhage settings. Once bleeding is under control, FFP administration should be guided by timely tests for coagulation
- **PT Ratio/INR >1.5 with bleeding** – Clinically significant bleeding without major haemorrhage. FFP required if coagulopathy. Aim for a PT and APTT ratio of ≤1.5
- **PT Ratio/INR >1.5 and pre-procedure** – Prophylactic use when coagulation results are abnormal e.g. disseminated intravascular coagulation and invasive procedure is planned with risk of clinically significant bleeding
- **Liver disease with PT Ratio/INR >2 and pre-procedure** – FFP should not be routinely administered to non-bleeding patients or before invasive procedures when the PT ratio / INR is ≤2
- **Thrombotic Thrombocytopenic Purpura (TTP)/plasma exchange**
- **Replacement of single coagulation factor.**

*National Blood Transfusion Committee Indication Codes for Transfusion, 2016.

**BSH guidelines for the treatment of TTP recommend the use of solvent detergent FFP (SD-FFP). SDFFP is made from a pool of several hundred donations which are leucodepleted and treated with solvent detergent to destroy viral pathogens; the residual levels of SD are not toxic. SDFFP is a licensed pharmaceutical product so reactions must be reported to the Medicines and Healthcare Products Regulatory Agency (MHRA), via the yellow card scheme, as well as to the Serious Adverse Blood Reactions and Events (SABRE) online scheme. Indications and shelf life of SDFFP are governed by the manufacturer.

FFP should NEVER be used as circulating volume replacement.
Dosage of FFP
In non-bleeding patients, the recommended starting dose of FFP is 15mL per kg of body weight. This equates to approximately 1L (four units) of FFP for an ‘average’ 70kg patient: heavier patients may require more units (but caution should be used in obese patients) and lighter patients fewer units.

In major haemorrhage, FFP should be used as part of initial resuscitation in at least a 1 unit: 2-unit ratio with red cells, until results from coagulation monitoring are available. Once bleeding is under control, further FFP should be guided by laboratory tests (transfusion trigger of PT and/or APTT >1.5 times normal) at a dose of 15-20mL/kg.

Please note
In September 2019, SaBTO withdrew the requirement to import and pathogen inactivate plasma. From April 2020 orders from NHSBT may be fulfilled with either non-UK (Methylene Blue MB pathogen inactivated) and/or UK plasma until current stocks of imported plasma are depleted.

Practical instructions for use of FFP
Once thawed, the FFP must not be refrozen and should be transfused as soon as possible using a standard blood administration set with a 170-200 micron filter. If delay is unavoidable, standard FFP and MBFFP may be used within four hours if kept at 22°C±2°C or within 24 hours if stored at 4°C±2°C (note - different conditions apply to SDFFP).

Pre thawed standard FFP can also be stored at 4°C±2°C for up to 120 hours for use only in patients who develop unexpected major bleeding e.g. following trauma. Note that the post thaw shelf life of MBFFP cannot be extended beyond 24 hours.

In an emergency, where pre-thawed FFP is not available, it is important to factor the thawing time of FFP into the availability of the component (usually 20-30 minutes).

The typical administration rate is 10-20mL/kg/hr, but this may vary depending on the patient’s condition.

Compatibility
ABO group identical FFP should be given whenever possible; if not possible, FFP of a different ABO group may be acceptable (this must be discussed with the hospital transfusion laboratory staff or haematologist).

ABO compatibility for plasma components is different to that of red cells and Group O FFP MUST only be given to Group O recipients.

Group AB FFP contains no ABO antibodies and can be given to anyone, but it is in short supply and should only be used for non-AB recipients if essential. If FFP is urgently needed for bleeding adult patients with unknown blood group, Group A FFP should be used which is high titre (HT) negative for anti-B activity.

Guidance on plasma blood group selection following ABO incompatible haematopoietic stem cell transplants is available in the 2018 BSH guidelines on the spectrum of FFP and cryoprecipitate products.

*Only suitable for emergency use in adults

Standard FFP units must be high-titre negative (HT-) for anti-A/anti-B.

MB FFP units are not tested for HT- for anti-A/anti-B. Group compatible MBFFP and SDFFP should be used wherever possible. Discuss possible options with your transfusion laboratory staff or haematologist.

**D group**

FFP does not need to be matched for D group. D positive plasma components may be given to D negative recipients without the need for anti-D Ig prophylaxis. The EU Blood Directive currently requires that the D group is stated on the label.

If you are unsure about the compatibility of FFP for your patient always check with your hospital transfusion laboratory staff before transfusing.

**Specific requirements**

FFP has no cellular content and therefore, does not need to be irradiated or to be selected as Cytomegalovirus (CMV) sero-negative.

The use of other frozen components produced by NHS Blood and Transplant is covered in a separate factsheet:

- Standard Cryoprecipitate.

NHS Blood and Transplant (NHSBT) saves and improves lives by providing a safe, reliable and efficient supply of blood and associated services to the NHS in England. We are the organ donor organisation for the UK and are responsible for matching and allocating donated organs. We rely on thousands of members of the public who voluntarily donate their blood, organs, tissues and stem cells.
