Investigation of suspected heparin-induced thrombocytopenia:

Platelet Activation: Negative Platelet Activation

Percentage Activation = 1.1% (Cut-off for positive reactions > 8%)

This patient's serum did not activate donor platelets.

These results DO NOT SUPPORT a diagnosis of heparin-induced thrombocytopenia.

Testing performed on peripheral blood unless otherwise indicated.

The platelet activation result above is for the incubation of patient serum with platelets and a pharmacological dose of heparin.

Incubation of platelets and patient serum alone showed 1% platelet activation.

Please ignore the automatically generated HIT conclusion comments above.

This investigation is not included in our scope of accreditation for ISO 15189:2012
