## **DAT2939/3 – Recall Reason Information for Hospitals**

This information sheet provides further details on recalls initiated by Hospitals i.e. due to Transfusion Reactions and Visual Abnormalities, and those recalled by NHSBT.

## Please note:

- If the unit is not transfused, there will be no follow up letter and the recall event can be closed
- For those events where a recall letter will be sent, they will be emailed to the Transfusion Laboratory Manager, Transfusion Practitioner and Consultant Haematologist responsible for Transfusion
- We aim to send a letter within 4 6 weeks however further testing may result in delay in which case, an interim letter will be sent
- Confirmatory testing will not provide information in a timeframe that is useful for the management of the patient
- For any unused/partially used components(s), submit FRM5219 Customer Credit Request Form. Use 'REC' as the credit code and select the appropriate reason under the drop-down section for 'Comments/Reason' for the recall
- See 'INF1210 NHSBT Component Recall Process' for summary

Hospital Recall Reason	Information	Action If Recalled Unit Transfused	Follow up
	If a patient had an acute transfusion reaction e.g. TRALI or bacterial contamination, other patients may be at risk from components from	Monitor patient for up to 24 hours. If no adverse reaction occurred, no further action required.	Letter sent following completion of investigation.
Transfusion Reaction	the same donation.  Hospitals are asked to contact NHSBT immediately so that associated units can be recalled.	If suspected transfusion reaction, discuss with local haematologist who can contact an NHSBT consultant via your local Hospital Services Department.	If suspected bacterial infection, the letter will usually be within 4 – 6 weeks.  A suspected TRALI may take longer.

Granulocytes	If any visual abnormality is identified within this component, please contact NHSBT for further advice

## **DAT2939/3 – Recall Reason Information for Hospitals**

	Hospital reported Visual Abnormality							
Component	Abnormality Type	Information	Action if recalled unit transfused	Follow up if transfused				
RBC	<ul><li>Clotted</li><li>Discoloured</li><li>Sticky</li><li>Haemolysed in the pack</li></ul>	Visually abnormal units suspected of bacterial contamination are returned for investigation to the MSL	Monitor patient for up to 24 hours.  If no adverse reaction occurred, no further action is required. If suspected transfusion reaction, discuss with local haematologist who can contact an NHSBT consultant via your local Hospital Services Department.	Letter sent following inspection and/or confirmatory results within 4 - 6 weeks.				
Platelet	<ul><li>Discoloured</li><li>Turbid (cloudy)</li><li>Large clumps/aggregates</li></ul>	Bacteriology laboratory within NHSBT.  Any associated components are recalled to prevent transfusion.						
Visual Abnormality - Other								
If unit is requested to be returned; it is visually examined at NHSBT but <b>not sent</b> to NBL for investigation.								
If the unit does not n	eed to be returned to NHSBT; one	ce reported you can discard the co	mponent on site and claim a credit.					
RBC	White flakes only     Lipaemic (fatty)							
FFP	Icteric (discoloured)     Lipaemic (fatty)	Other visual abnormal units not						
CRYO	White flakes (clumping, aggregates)	suspected of bacterial contamination	None	None, recall event can be closed				
Platelet	White deposit     Small flakes							

Small flakesResidue

## **DAT2939/3 – Recall Reason Information for Hospitals**

NHSBT Recall Reason	Information	Action If Recalled Unit Transfused	Follow up
Bacterial Screening	A sample from platelet units are monitored for bacteria during their shelf life. When there is an alert after the platelets (or associated components) have been issued, confirmatory tests are performed (may take up to 4 weeks).  Most alerts are false positives or clinically insignificant bacteria.	Monitor patient for up to 24 hours. If no adverse reaction occurred, no further action is required.  If suspected transfusion reaction, discuss with local haematologist who can contact an NHSBT consultant via your local Hospital Services Department.	Letter sent following confirmatory results, usually within 4 - 6 weeks.
Donor Information	Additional information provided by donors post donation e.g. flu, sickness, infection, travel. These events are usually extremely low risk to the patient.	None, unless donor has had chicken pox, shingles, Covid-19 in which case NHSBT will contact you with further advice	None, recall event can be closed.
Microbiology Reactive	If a donation tests positive for mandatory testing, MHRA requires a recall of in-date components from the previous donation. This is a precaution while the current donation is sent for confirmatory testing.  The majority of these investigations do not confirm an infected donation.	None*	None, recall event can be closed.
Transfusion Microbiology Lookback	Possible post transfusion-transmitted (non-bacterial) infection has been reported to NHSBT from a hospital. A lookback exercise is performed to identify implicated donations.	None*	None, recall event can be closed.
Quality Defect	Non-compliance with NHSBT quality system.	None*	None, recall event can be closed.
Non-UK Plasma	Non-UK plasma supplier recalls the unit.	None*	None, recall event can be closed.

<sup>\*</sup> Under rare circumstances, NHSBT Clinical Support Team will make contact if further action is required
