ADULT INTESTINAL TRANSPLANTS

How long do adults wait for an elective intestine transplant?

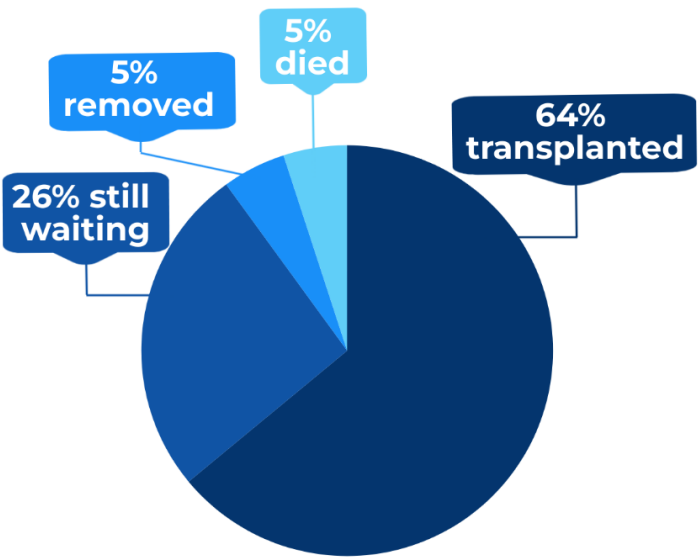

The median is a type of average and is the time when half of patients have received a transplant

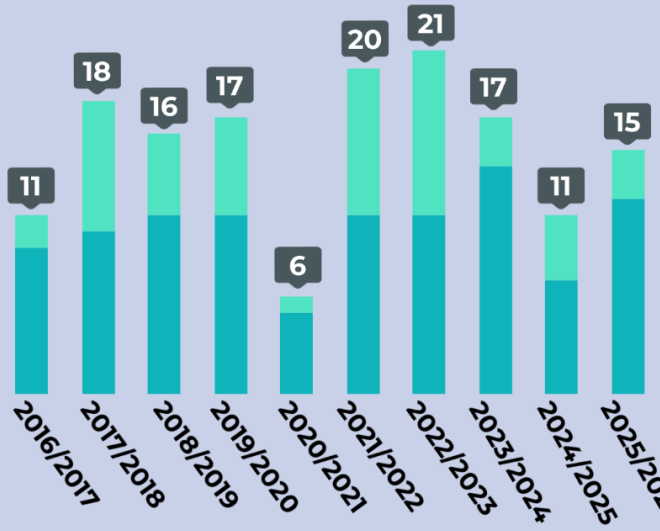

Overall median waiting time to intestine transplant for registrations between 1 April 2022 and 31 March 2025 was 136 days, or 4.5 months.

Lots of things affect how long you might wait, including your blood group, sensitisation and the availability of the right size organs

Nationally, 6 months after going on the elective list

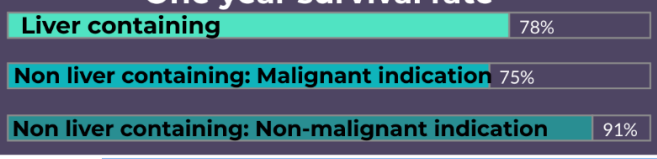

Overall number of transplants per year between 1 April 2016 - 31 March 2026

What are the chances of surviving for one year after transplant?

On average, **78 out of 100** patients are alive one year after an elective intestinal transplant with a liver. For non-liver transplants, survival rates are **75 out of 100** for malignant cases and **91 out of 100** for non-malignant cases.

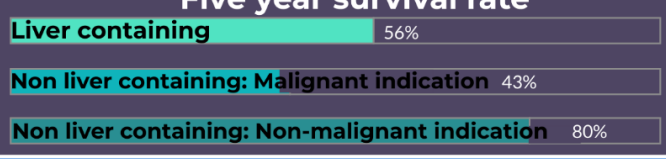

One year survival rate

What are the chances of surviving for five years after transplant?

On average, **56 out of 100** patients are alive five years after an elective intestinal transplant with a liver. For non-liver transplants, survival rates are **43 out of 100** for malignant cases and **80 out of 100** for non-malignant cases.

Five year survival rate
